No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0647h0 arachis h

The invention relates to a modified anaphylactic food allergen has an amino acid sequence that is substantially identical to that of natural anaphylactic food allergen, except for a cysteine residue that has been modified so that it cannot participate in the disulphide bond. The modified so that it cannot participate in the disulphide bond. The modified anaphylactic food allergen, (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (2) a nucleotide molecule encoding or for causing a site specific mutation in the modified anaphylactic food allergen; (3) a transgenic plant or animal expressing the modified anaphylactic food allergen; (4) a method of treating an individual by reducing the clinical response to a natural anaphylactic food allergen is useful for preventing or treating allergic cand an isolated fragment of peanut allergen Ara h. The modified anaphylactic food allergen is useful for preventing or treating allergic reactions associated with any natural allergen such as food, insect, treating wounds in mammals such as bovine, canne, feline, caprine, covine, portine, murine or equine species. The present sequence is a conne, allergen (e.g. Ara h), h2 or h3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           420
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

cc of making a modified anaphylactic food allergen, a nucleotide molecule encoding a modified anaphylactic food allergen defined above, a nucleotide molecule for causing a site specific mutation in a gene encoding a natural anaphylactic food allergen, a transgenic plant or animal expressing a modified anaphylactic food allergen defined above, a natural anaphylactic food allergen by administering a modified above, a natural anaphylactic food allergen by administering a modified above, a natural anaphylactic food allergen by administering a modified or anaphylactic food allergen by administering a modified or Ara h., comperising at least 10 consecutive amino acids of AbG27464 or ABG27465. About 10-17% of the amino acids have been modified in at least one IgE epitope or all the IgE epitopes recognised when the natural anaphylactic food allergen is contacted with serum IgE from individual(s) allergen to the natural anaphylactic food allergen. The thinention discloses Peanut allergen Ara hl. Ara h2. Ara h3 (and thair encoding connected by the anaphylactic food allergen can be used for treating allergen reactions or wounds. The present sequence used for treating allergen of the invention (or its fragment).

The natural anaphylactic food allergen includes at least one cysteine residue that participates in a disulphide bond when the natural anaphylactic food allergen is in its native conformation, except that the cysteine residue has been modified so that it cannot participate in the disulphide bond. Also included are a method

The sequence represents the amino acid sequence of anaphylactic antigen are an anaphylactic antigen (A), which was used to design antigentic perplayers are accounted ability to bind immunoglobulin E (19E) as compared with the intact (A), or having a sequence substantially identical to a portion of sequence of an antigen that includes at least one 19E binding site of the peptide or altered. The antigenic peptides are used in a composition which is useful for reducing risk or severity of allergic reaction to an antigen. This is done by identifying are individual at risk of allergic reaction to an antigen. The antigen, or afamiliar relationship with an individual who content and allergic symptoms when exposed to the antigen. Specific 19E present on one or more mast cells or basophise in the individual's serum is identified. The individual is the individual's ecum is indentified. The individual is the individual's serum is selected, formulated, and delivered so that binding of the operation of peptide to antigen. The composition is also useful for treating and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel antigen presentation enhancing hybrid polypeptide. The novel polypeptide has an N-terminal element consisting of 4-16 residues of a mammalian II-Rey peptide and its non-N-terminal deletion modifications, a chemical structure covalantly linking the N-terminal element to an MHC class II-presented epitope of a C-terminal binds to an antigenic peptide binding site of an MHC class II molecule. The C-terminal element comprises an antigenic epitope, which binds to an antigenic peptide binding site of an MHC class II molecule. The antigen presentation enhancing hybrid polypeptide has the following activities; antibacterial, virucide, fungicide, antirheumatic, antiatiachective, dermatological, immunosuppressive, antinflammatory, antidiabetic, and antithyroid. The antigen presentation enhancing hybrid polypeptide is useful for modulating the immune response in an individual and for treating infections (such as bacteria, virus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel Ii-Key/antigen presentation enhancing hybrid polypeptide, useful for treating infections, rheumatoid arthritis, multiple sclerosis, lupus erythematosus and diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                          This is the amino acid sequence of the Ara h 3 protein from Arachis hypogea. The Ara h 3 protein has 4 IgE (Immunoglobulin B) binding epitopes, one of which is immunodominant (AAVIS281). Note: The first three amino acids of this sequence are not encoded by the related nucleotide sequence. By modifying the IgE binding sites the ability of the allergen to provoke an immune response is downregulated. The epitopes of the IgE binding sites can therefore be modified in genetically engineered plants and animals to elicit less of an allergic response. (Updated on 17-OCT-2003 to standardise OS field)

                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides a tertiary structure for the peanut allergen Ara H 1. The Ara H 1 allergen is found to contain 23 linear IgE-binding epitopes. The invention also provides an isolated recombinant peanut allergen designated Ara h 3 and a nucleotide molecule encoding the peanut allergen Ara h 3. Molecules of the invention are used to protect a host animal from allergic reaction, particularly using a modified allergen which is less reactive with IgE. The invention may also be used to ensure that the allergen is not introduced into genetically modified food. The present sequence represents a DNA encoding the Ara h 3 allergen.
